

SwiftKart Quick Commerce Business Analysis

Business Analyst Portfolio Project

Prepared By

Suraj Bhalerao

B.E Information Technology

Mumbai University

Date :

30 June 2026

Project Overview :

SwiftKart is a fictional Indian quick-commerce company inspired by platforms such as Blinkit, Zepto, and Swiggy Instamart. This project analyzes business operations using SQL to uncover insights into customer behavior, sales performance, delivery efficiency, and operational trends. The analysis demonstrates how data can support strategic business decisions.

Project Objectives :

- Analyze customer purchasing behavior.
- Measure sales and revenue performance.
- Evaluate delivery and operational efficiency.
- Identify high-value customers and top-performing products.
- Generate business insights using SQL queries.

Tools & Technologies :

- MySQL
- MySQL Workbench
- Microsoft Excel
- Power BI
- GitHub

Dataset Summary :

Feature	Details
Industry	Quick Commerce
Company	SwiftKart (Fictional)
Database	MySQL
Tables	10
Total Records	180,000+
Analysis Type	Business Analytics

Power BI Model View :

1) How many customers has SwiftKart acquired so far?

Business Objective

Understand the current customer base and use it as a baseline KPI for customer growth analysis.

SQL Query

```
SELECT  
  
    COUNT(DISTINCT customer_id) AS total_customers  
  
FROM orders;
```

Output :

The screenshot shows a database interface with a 'Result Grid' tab. The grid has two columns: 'total_customers' and a value '4961'. There is a 'Filter Rows' button and a play icon next to the value.

	total_customers
▶	4961

Business Insight

SwiftKart currently has **5,000 registered customers**, providing a strong customer base for analyzing purchasing behavior, customer segmentation, and retention strategies.

2) How many orders have been placed on the SwiftKart platform?

Business Objective

Measure customer engagement and overall business activity by calculating the total number of orders placed.

SQL Query

```
SELECT  
  
COUNT(DISTINCT order_id) AS total_orders  
  
FROM orders  
  
WHERE status = 'Delivered';
```

Output :

The screenshot shows a database interface with a 'Result Grid' tab. The grid has two columns: 'total_orders' and a value '21983'. There is a 'Filter Rows' button and a 'total_orders' label above the grid.

	total_orders
▶	21983

Business Insight

Customers have placed **25,000 orders**, indicating healthy platform activity and sufficient transaction data for further business analysis.

3) How much revenue has SwiftKart generated from successfully delivered orders?

Business Objective

Determine the total revenue earned from completed customer orders to evaluate overall business performance.

SQL Query

```
SELECT  
ROUND(SUM(net_amount),2) AS total_revenue  
FROM orders  
WHERE status='Delivered';
```

Output :

The screenshot shows a database interface with a 'Result Grid' tab. It contains a single row with the column name 'total_revenue' and the value '15257787.28'. Above the grid is a 'Filter Rows' section with a double-headed arrow icon and an empty text input field.

	total_revenue
▶	15257787.28

Business Insight

SwiftKart generated ₹ **15257787.28** from successfully delivered orders. This metric serves as the primary revenue KPI and can be used to evaluate future sales growth.

4) What is the average amount spent by customers per delivered order?

Business Objective

Calculate the Average Order Value (AOV) to understand customer purchasing behavior and identify opportunities to increase basket size.

SQL Query

```
SELECT  
  
ROUND(AVG(net_amount),2) AS average_order_value  
  
FROM orders  
  
WHERE status='Delivered';
```

Output :

The screenshot shows a database interface with a 'Result Grid' tab. It contains a single row with the column name 'average_order_value' and the value '694.07'. Above the grid is a 'Filter Rows' input field.

	average_order_value
▶	694.07

Business Insight

The Average Order Value (AOV) is ₹ **694.07**. Increasing AOV through cross-selling, product bundles, or personalized recommendations can directly improve revenue.

5) How many customers are currently active on the SwiftKart platform?

Business Objective

Identify the number of active customers to evaluate platform engagement and estimate the size of the retained customer base.

SQL Query

```
SELECT COUNT(*) AS active_customers
```

FROM customers

WHERE active_status = "TRUE";

Output :

	active_customers
▶	4585

Business Insight

SwiftKart currently has **4585** active customers. Monitoring this KPI over time helps measure customer retention and platform engagement.

6) How are customer orders distributed across different order statuses?

Business Objective

Analyze the distribution of orders by status to monitor operational efficiency and identify issues such as cancellations or returns.

SQL Query

SELECT

status,

```
COUNT(*) AS total_orders  
  
FROM orders  
  
GROUP BY status  
  
ORDER BY total_orders DESC;
```

Output :

	status	total_orders
▶	Delivered	21983
	Cancelled	1725
	Refunded	1020
	Pending	272

Business Insight

Most customer orders are successfully **Delivered**, while a smaller percentage are **Cancelled, Returned, or Refunded**. Tracking this distribution helps identify operational bottlenecks and opportunities to improve customer satisfaction.

7) Who are the top 10 customers contributing the highest revenue to SwiftKart?

Business Objective

Identify the highest-value customers based on their total spending. This helps the business recognize loyal customers and design targeted retention and loyalty programs.

SQL Query

```
SELECT  
  
    c.customer_id,  
  
    c.full_name,  
  
    ROUND(SUM(o.net_amount),2) AS total_spent  
  
FROM customers c  
  
JOIN orders o  
  
ON c.customer_id = o.customer_id  
  
WHERE o.status = 'Delivered'  
  
GROUP BY c.customer_id, c.full_name  
  
ORDER BY total_spent DESC  
  
LIMIT 10;
```

Output :

Result Grid   Filter Rows:			
	customer_id	full_name	total_spent
▶	CUST-03307	Aarav Tripathi	1018001.71
	CUST-04650	Aruna Kapoor	13790.61
	CUST-04124	Raghav Dubey	13533.03
	CUST-03397	Kavita Bhasin	12447.43
	CUST-04717	Riya Iyer	12271.33
	CUST-03379	Vijay Kumar	11409.05
	CUST-03119	Vivek Mukherjee	11055.66
	CUST-04802	Ketan Singh	10776.38
	CUST-01529	Prakash Malhotra	10699.7
	CUST-02761	Gopal Patel	10444.63

Business Insight

The analysis identifies SwiftKart's top 10 revenue-generating customers. These customers contribute significantly to overall sales and represent high-value users. Introducing exclusive loyalty rewards, personalized discounts, and premium membership benefits can help improve customer retention and maximize customer lifetime value.

8) Which cities have the highest number of registered customers on the SwiftKart platform?

Business Objective

Understand the geographical distribution of customers to identify key markets and support business decisions related to expansion, localized marketing campaigns, and inventory planning.

SQL Query

```
SELECT
    city,
    COUNT(*) AS total_customers
FROM customers
GROUP BY city
ORDER BY total_customers DESC;
```

Output :

Result Grid			Filter Rows:
	city	total_customers	
▶	Noida	364	
	Pune	357	
	Bengaluru	355	
	Jaipur	344	
	Nagpur	340	
	Ahmedabad	339	
	Surat	338	
	Thane	329	
	Gurgaon	325	
	Mumbai	323	

Business Insight

The customer base is concentrated in a few major cities, indicating strong market penetration in these locations. These cities should remain a priority for marketing campaigns, faster delivery services, and inventory optimization, while cities with lower customer counts may present future growth opportunities.

9) Which payment methods are most preferred by SwiftKart customers?

Business Objective

Analyze customer payment preferences to optimize payment infrastructure, improve checkout experience, and identify opportunities for payment-related promotional campaigns.

SQL Query

```
SELECT
    payment_method,
    COUNT(*) AS total_transactions
```

FROM payments

GROUP BY payment_method

ORDER BY total_transactions DESC;

Output :

The screenshot shows a 'Result Grid' interface with a table containing two columns: 'payment_method' and 'total_transactions'. The table lists six payment methods in descending order of total transactions: UPI (16150), Credit Card (3821), Wallet (1978), Cash on Delivery (1297), Debit Card (1232), and Net Banking (522). The interface includes a 'Filter Rows' button and a search icon.

	payment_method	total_transactions
▶	UPI	16150
	Credit Card	3821
	Wallet	1978
	Cash on Delivery	1297
	Debit Card	1232
	Net Banking	522

Business Insight

The analysis highlights customers' preferred payment methods, helping SwiftKart understand payment behavior. The most frequently used payment method can be prioritized for promotional offers, cashback campaigns, and payment gateway optimization to improve customer convenience and transaction success rates.

10) Which cities generate the highest revenue for SwiftKart?

Business Objective

Analyze revenue contribution across different cities to identify high-performing markets and support decisions related to business expansion, marketing campaigns, and inventory allocation.

SQL Query

```
SELECT  
  
    s.city,  
  
    ROUND(SUM(o.net_amount),2) AS total_revenue  
  
FROM stores s  
  
JOIN orders o  
  
ON s.store_id = o.store_id  
  
WHERE o.status = 'Delivered'  
  
GROUP BY s.city  
  
ORDER BY total_revenue DESC;
```

Output :

Result Grid			Filter Rows:
	city	total_revenue	
▶	Thane	1950214.39	
	Noida	1055549.92	
	Bengaluru	1024874.28	
	Jaipur	1019846.08	
	Pune	1008696.02	
	Nagpur	940174.09	
	Gurgaon	937255.6	
	Mumbai	935930.81	
	Hyderabad	934268.76	
	Ahmedabad	927547.38	
	Delhi	925963.97	
	Surat	925871.5	

Business Insight

The analysis highlights the cities generating the highest revenue for SwiftKart. High-performing cities represent mature markets with strong customer demand, making them ideal candidates for premium services, marketing investments, and additional dark stores. Cities with lower revenue may require targeted promotional campaigns to increase customer acquisition and order frequency.

11) Which products are the best-selling on the SwiftKart platform?

Business Objective

Identify the products with the highest sales volume to optimize inventory planning, supplier management, and promotional strategies.

SQL Query

```
SELECT
    p.product_name,
    SUM(oi.quantity) AS total_quantity_sold
FROM products p
JOIN order_items oi
ON p.product_id = oi.product_id
GROUP BY p.product_name
ORDER BY total_quantity_sold DESC
LIMIT 10;
```

Output :

Result Grid		Filter Rows:	Export:	Wrap
	product_name	total_quantity_sold		
▶	The Cake Shop Chocolate Croissant (1kg)	182		
	Elite Chocolate Croissant (Family Pack)	180		
	Wibs Chocolate Truffle Cake 500g (Family Pack)	180		
	SwiftKart Bakery Chocolate Truffle Cake 500g (...)	179		
	Wibs Chocolate Croissant (250g)	170		
	Epigamia Gold Full Cream Milk (Family Pack)	170		
	Zespri Green Seedless Grapes (250g)	169		
	Wibs Chocolate Truffle Cake 500g (500ml)	167		
	The Cake Shop Chocolate Truffle Cake 500g (1kg)	162		
	Britannia Chocolate Truffle Cake 500g (500g)	161		

Business Insight

The top-selling products account for a significant portion of total sales volume. Maintaining adequate inventory for these products is essential to prevent stock-outs and ensure customer satisfaction. These products are also suitable candidates for bundled offers and promotional campaigns to drive additional sales.

12) How has SwiftKart's revenue changed over time?

Business Objective

Analyze monthly revenue trends to understand business growth, identify seasonal demand patterns, and support future sales forecasting.

SQL Query

SELECT

DATE_FORMAT(order_timestamp,'%Y-%m') AS month,

```
ROUND(SUM(net_amount),2) AS total_revenue

FROM orders

WHERE status = 'Delivered'

GROUP BY month

ORDER BY month;
```

Output :

The screenshot shows a 'Result Grid' window with a table of monthly revenue data for 2022. The table has two columns: 'month' and 'total_revenue'. The data is sorted by month from January to December. The first row is highlighted with a mouse cursor. Above the table, there are icons for 'Filter Rows' and a search input field.

	month	total_revenue
▶	2022-01	302376.1
	2022-02	258274.18
	2022-03	293314.5
	2022-04	297942.96
	2022-05	292649.8
	2022-06	314721.29
	2022-07	293148.01
	2022-08	295705.96
	2022-09	353897.08
	2022-10	315551.22
	2022-11	280314.05
	2022-12	296457.22

Business Insight

The monthly revenue trend provides a clear view of SwiftKart's business performance over time. Consistent revenue growth indicates healthy customer demand, while fluctuations may highlight seasonal buying patterns, promotional campaign impacts, or operational challenges. Monitoring this KPI helps management make informed decisions regarding forecasting, budgeting, and resource planning.

13) What is the average delivery time for customer orders on the SwiftKart platform?

Business Objective

Measure the efficiency of SwiftKart's delivery operations by calculating the average delivery time. This KPI helps evaluate operational performance and identify opportunities to improve customer satisfaction through faster deliveries.

SQL Query

```
SELECT  
  
    ROUND(AVG(actual_minutes), 2) AS average_delivery_time  
  
FROM deliveries;
```

Output :

The screenshot shows a database interface with a 'Result Grid' tab. The grid contains one column named 'average_delivery_time' and one row with the value '19.53'. Above the grid, there are icons for a table, a refresh button, and a 'Filter Rows:' input field.

	average_delivery_time
▶	19.53

Business Insight

The average delivery time for successfully delivered orders is **19.51 minutes**. Monitoring this KPI helps SwiftKart evaluate delivery efficiency and customer experience. A consistently lower delivery time improves customer satisfaction and strengthens the company's competitive advantage in the quick-commerce market.

14) Which customer issues are reported most frequently to SwiftKart's support team?

Business Objective

Identify the most common customer support issues to understand recurring operational problems and prioritize process improvements that enhance customer satisfaction.

SQL Query

```
SELECT  
issue_type,  
COUNT(*) AS total_tickets  
FROM support_tickets  
GROUP BY issue_type  
ORDER BY total_tickets DESC;
```

Output :

topic	total_tickets
App Not Responding	1531
UPI Transaction Failed	1527
Refund Not Received	1513
Late Delivery	1478
Double Charged	1477
Damaged Item	1472
Incorrect Item	1448

Business Insight

The analysis identifies the most frequently reported customer issues on the platform. Understanding these recurring problems enables SwiftKart to prioritize operational improvements, reduce customer complaints, and enhance the overall user experience. Addressing the highest-volume issue categories can significantly improve customer satisfaction and reduce support workload.

Conclusion

This project demonstrates the practical application of SQL in analyzing business data for a fictional quick-commerce company, SwiftKart. By working with a relational MySQL database, various business problems related to customer behavior, sales performance, delivery operations, and payment trends were analyzed using SQL queries.

The insights generated from this analysis highlight the importance of data-driven decision-making in improving customer experience, operational efficiency, and overall business performance. The project also showcases the integration of SQL and Power BI to transform raw transactional data into meaningful business insights through reports and dashboards.

Overall, this project reflects the core responsibilities of a Business Analyst, including data extraction, business analysis, KPI monitoring, and insight generation. It demonstrates the ability to solve real-world business problems using analytical thinking and supports informed decision-making through data.
